

## RAPPORT 1378

Nota Maasmechelen, Bedrijventerrein  
Nieuwe Bunders

### Bijlagen

Petra Driesen & Willem Vanaenrode  
Met bijdrage van Eckhart Heunks  
2023-2026

# BIJLAGEN

Bijlage 1: Periodentabel A4

Bijlage 2: Inplantingsplan boortransecten op het kadaster met aanduiding van de geplande werken

Bijlage 3: Transecttekeningen (niet ingekleurd)

Bijlage 4: Landschapsprofielen (ingekleurd)

Bijlage 5: Boorbeschrijvingen

Bijlage 6: Vondsten- en stalenlijst LB

Bijlage 7: Fotolijst

Bijlage 8: Ontwerpplannen Nieuwe Bunders Droogweide Zuid & Droogweide Noord (zone 1 en 2)

Bijlage 9: Ontwerpplannen fietspaden

Bijlage 10: Waardering grondstalen i.f.v. geschiktheid voor <sup>14</sup>C-analyse (Archol)

Bijlage 11: Dateringsrapport KIK

Bijlage 12: Waarderend onderzoek botanie (Archol)

Bijlage 13: Proefsleuvenplan fase 1 bestaande toestand

Bijlage 14: Proefsleuvenplan fase 1 ontworpen toestand

Bijlage 15: Transect proefsleuvenonderzoek fase 1

Bijlage 16: Bodemprofielen fase 1

Bijlage 17: Profielbeschrijvingen fase 1

Bijlage 18: Coupetekeningen fase 1

Bijlage 19: Sporenlijst fase 1

Bijlage 20: Vondstenlijst fase 1

## Legende

### Lithogenese

#### Laat-Pleistoceen

##### Laat-Pleniglaciaal (<15.000 cal BP)

- Grindrijke beddingafzettingen
- Deklaag: complex van fluviatiele en eolische afzettingen

##### Jonge Dryas (13.000 - 11.700 cal BP)

- Grindrijke beddingafzettingen

#### Holoceen

##### Meandergordel (Subboreaal - Vroeg-Subatlanticum)

- Grindrijke beddingafzettingen
- Zandige oever- en restgeulafzettingen (zand, lemig zand)
- Lemige oever- en restgeulafzettingen (licht zandleem, zandleem, leem)
- Kleiige kom- en restgeulafzettingen

##### Overig

- Overafzettingen late protohistorie
- Overafzettingen Romeinse tijd - Moderne tijd

### Bodemvorming

- Bw-horizont

### Overig

- Bouwvoor en/of diepere bodemverstoring
- Contour restgeul
- Diepte archeologisch niveau
- Vondst
- Monster
- Bodemhorizonten
- Textuurklassen

# Waarderend onderzoek botanie

*Nieuwe bunders Maasmechelen (België)*

## Waarderingsrapport

M.T.I.J. Gouw-Bouman

Versie 1.0 concept

# 1 Inleiding

In het onderzoeksgebied Nieuwe Bunders Maasmechelen zijn diverse restgeulen aangetroffen. De basis van één van deze restgeulen is bemonsterd voor palynologisch onderzoek om zo de ouderdom van de restgeul en het moment van het verlaten van de rivierbedding te bepalen (Tabel 1).

Tabel 1 Selectie te onderzoeken pollenmonsters.

| vondstnr | Boring | Diepte         | categorie |
|----------|--------|----------------|-----------|
| M6       | 104    | 300-315 cm -mv | MP        |

## 2 Materiaal en methoden

### 2.1 Pollen

In het veld is uit boring 104 een submonster genomen van het segment 300-315 cm -mv. Uit dit kerndeel is een monster, met een volume van ca. 2 cm<sup>3</sup>, volgens de standaardmethoden van Fægri & Iversen door het Laboratorium Sedimentanalyse op de Vrije Universiteit opgewerkt. Gedurende de bereiding is er een vastgesteld aantal sporen van een exotische (niet inheemse) varen (*Lycopodium*) aan het materiaal toegevoegd. Aan de hand van het aantal sporen die tijdens de analyse worden aangetroffen kan een inschatting worden gemaakt van de oorspronkelijke concentratie pollen in het sediment. De preparaten zijn doorgekeken met een microscoop met een vergroting van 400 tot 1000-maal. De in het preparaat aanwezige microfossielen (pollen, sporen) zijn gedetermineerd aan de hand van de standaarddeterminatiewerken.<sup>1</sup> Daarnaast is gebruik gemaakt van diverse online pollen databases.<sup>2</sup> Naamgeving van pollentypen is uit de standaarddeterminatiewerken overgenomen.<sup>3</sup> Aanvullend zijn ook Non Pollen Palynomorfen (NPP) geïdentificeerd. Onder deze microscopische resten vallen schimmelsporen, algen maar ook dierlijke resten of delen van planten.<sup>4</sup> Nog niet op naam gebrachte of geïdentificeerde NPP worden aangeduid met een type-nummer.<sup>5</sup> Daar ook van veel niet-geïdentificeerde NPP bekend is in welke omstandigheden deze voorkomen, kunnen ook deze resten veel informatie verschaffen over het afzettingmilieu.

Voor de ouderdomsbepaling is een deel van het preparaat geanalyseerd om een inschatting te kunnen maken van de verhouding van de belangrijkste pollentypen. Daarnaast is de rest van het preparaat doorgekeken of er nog aanvullende pollentypen, die niet tijdens de analyse waren aangetroffen, in aanwezig waren. De resultaten van deze korte analyse zijn weergegeven in tabel 2. Een pollensom (100 %) met daar in bomen en kruiden van droge gronden is gebruikt om de relatieve bijdragen (percentages) per pollentype uit te rekenen.

<sup>5</sup> Miola 2012

### 3 Resultaten ouderdomsbepaling

Het pollen in het preparaat was redelijk gecorrodeerd maar voor het grootste deel was determinatie nog mogelijk. Het overgrote deel van het aanwezig pollen bestond uit den en hazelaar (Tabel 2). Er was een enkele pollenkorrel van berk en els aanwezig. Ook was er mogelijk een pollenkorrel van eik aanwezig in het materiaal al was deze sterk gecorrodeerd en determinatie niet zeker.

Het vegetatiebeeld gedomineerd door den en hazelaar en de enkele els en mogelijk eik geeft een datering in het Boreaal aan (afbeelding 1). Het Boreaal komt in België overeen met ca. 8000 – 7000 v. Chr. De start van het Boreaal is in het maasdal in de omgeving van Roermond gedateerd op ca. 8760 v. Chr. <sup>6</sup> De relatief hoge percentages van hazelaar in het onderzochte monster geven aan dat het monster niet uit het begin van het Boreaal dateert. De onderste invulling van de restgeul heeft dus plaatsgevonden in het Boreaal, dit geeft aan dat de geul vlak hiervoor verlaten is.
